

Three station spine screen

Please place markers at level T-3 (approx. a hands width below C-7 prominens) and one at the level of L-1 (approx. a hands width above the crest).

Smallest FOV possible should be used, approx. 220 for cervical, 250 for thoracic, and 220 for lumbar. Be sure to adjust FOV so that one marker is seen on cervical and lumbar images and two markers are seen on thoracic images. This ensures that there is an overlap and that **all** anatomy is seen.
